

# REGIONAL MATHEMATICS OLYMPIAD – 2015

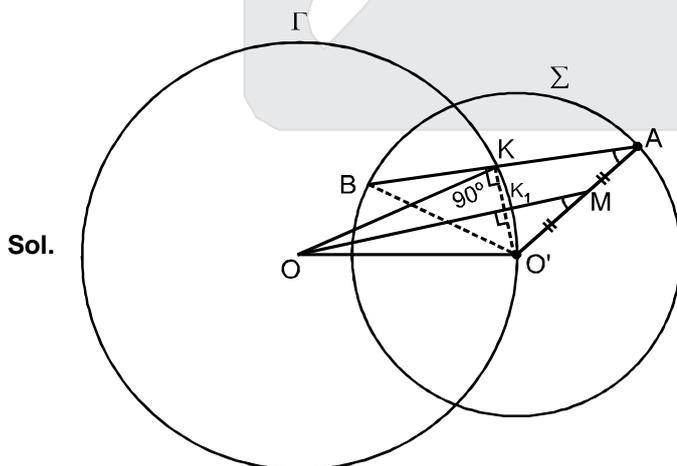

## Centre - Delhi

Time: 3 Hours

December 06, 2015

Instructions:

- Calculators (in any form) and protractors are not allowed.
  - Rulers and compasses are allowed.
  - Answer all the questions.
  - All questions carry equal marks. Maximum marks: 102.
  - Answer to each question should start on a new page. Clearly indicate the question number.
1. Two circles  $\Gamma$  and  $\Sigma$ , with centres  $O$  and  $O'$ , respectively, are such that  $O'$  lies on  $\Gamma$ . Let  $A$  be a point on  $\Sigma$  and  $M$  the midpoint of the segment  $AO'$ . If  $B$  is a point on  $\Sigma$  different from  $A$  such that  $AB$  is parallel to  $OM$ , show that the midpoint of  $AB$  lies on  $\Gamma$ .

To prove  $O'K \perp AB$  as  $O'A = O'B$  (radii of circle  $\Sigma$ )

Also  $OK = OO'$  (radii of circle  $\Gamma$ )

$\Delta O'MK_1$  and  $\Delta O'AK$  are similar

Triangles  $\Rightarrow K_1O' = KK_1 \Rightarrow \angle O'K_1O = 90^\circ$

Which implies  $\angle O'KB = 90^\circ$

or  $KA = KB$

2. Let  $P(x) = x^2 + ax + b$  be a quadratic polynomial where  $a$  and  $b$  are real numbers. Suppose  $\langle P(-1)^2, P(0)^2, P(1)^2 \rangle$  is an arithmetic progression of integers. Prove that  $a$  and  $b$  are integers.

Sol. Given  $[P(-1)]^2 = (b - a + 1)^2 \in I$

$$(P(0))^2 = b^2 \in I$$

$$(P(1))^2 = (b + a + 1)^2 \in I$$

$$\therefore [P(-1)]^2, (P(0))^2, (P(1))^2 \text{ are in AP}$$

$$\Rightarrow 2b^2 = (b - a + 1)^2 + (b + a + 1)^2$$

$$\Rightarrow a^2 + 2b + 1 = 0$$

$$a^2 + b^2 + 1 - 2a + 2b - 2ab = I_1 \quad \text{----- (1)}$$

$$a^2 + b^2 + 1 + 2a + 2b + 2ab = I_2 \quad \text{----- (2)}$$

$$(2) - (1) \quad 4a(1 + b) = I \quad \text{----- (3)}$$

$$b^2 \in I$$

**Case-I**  $b \in \mathbb{Q}$

So if  $b$  is any rational number then it can be integer only as its square is integer.

$$\Rightarrow \boxed{b \in I}$$

$\therefore (a + b + 1)^2$  is integer (i)  $a \in \mathbb{Q} \Rightarrow a \in \text{Integer}$

(ii)  $a \in \mathbb{Q}^c \Rightarrow$  then  $(b - a + 1)^2$  can not be an integer

**Case-II**  $b \notin \mathbb{Q}$

$b^2$  is integer

$\therefore a^2 + 2b + 1 = 0$  (from A.P. condition)

$$\Rightarrow 2b = -(1 + a^2)$$

$\Rightarrow b$  is negative

Let  $b^2 = m ; m \in \mathbb{I}$

$$\Rightarrow b = -\sqrt{m}$$

$$a^2 = 2\sqrt{m} - 1$$

From Eqn (3)  $4a(1 + b) = I$

on squaring

$$16a^2(1 + b)^2 = I^2$$

$$16(2\sqrt{m} - 1)(1 - \sqrt{m})^2 = I^2$$

$$16(2\sqrt{m} - 1)(1 + m - 2\sqrt{m}) = I^2$$

$$16[2m\sqrt{m} + 4\sqrt{m} - 5m - 1] = I^2$$

$$\Rightarrow 2m\sqrt{m} + 4\sqrt{m} - 5m - 1$$

should be rational which is not possible for any integer value of  $m$

$\Rightarrow b$  can not be irrational.

3. Show that there are infinitely many triples  $(x, y, z)$  of integers such that  $x^3 + y^4 = z^{31}$ .

**Sol.**  $x^3 + y^4 = z^{11}$

Let  $x = 0 \Rightarrow y^4 = z^{11} \Rightarrow y = z^{\frac{11}{4}}$  (many values of  $z$  of the form  $(\text{integer})^4$  will give integral values of  $y$ . so infinite sets.

4. Suppose 36 objects are placed along a circle at equal distances. In how many ways can 3 objects be chosen from among them so that no two of the three chosen objects are adjacent nor diametrically opposite?

Sol.  ${}^{36}C_3 - 36 - 36(32) - 18 \times 30$

Total ways of 3 selections =  ${}^{36}C_3$

Three at adjacent positions = 36

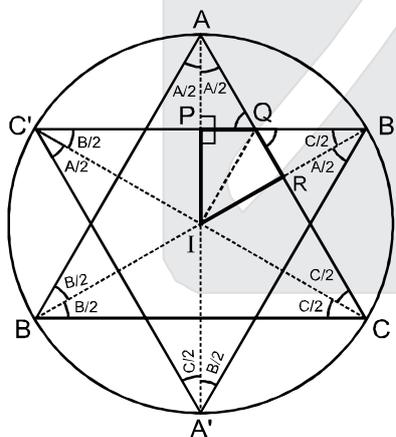

Exactly two at consecutive positions =  $36 \times 32$

Diametrically opposite but not adjacent =  $\frac{36 \times 30}{2}$

$$\begin{aligned} \text{So } & {}^{36}C_3 - 36 - 36 \times 32 - 18 \times 30 \\ & = 5412 \end{aligned}$$

5. Let  $ABC$  be a triangle with circumcircle  $\Gamma$  and incentre  $I$ . Let the internal angle bisectors of  $\angle A$ ,  $\angle B$ , and  $\angle C$  meet  $\Gamma$  in  $A'$ ,  $B'$  and  $C'$  respectively. Let  $B'C'$  intersect  $AA'$  in  $P$  and  $AC$  in  $Q$ , and let  $BB'$  intersect  $AC$  in  $R$ . Suppose the quadrilateral  $PIRQ$  is a kite; that is  $IP = IR$  and  $QP = QR$ . Prove that  $ABC$  is an equilateral triangle.

Sol.

$PIRQ$  is a kite

$\angle PQA = \angle RQB$  (vertically opposite)

$\angle QPI = \angle QRI$  (kite)  $\Rightarrow \angle APQ = \angle QRB$

$\Rightarrow \triangle APQ \cong \triangle B'RQ$  (ASA)

$\Rightarrow \frac{A}{2} = \frac{C}{2} \Rightarrow \angle A = \angle C$

- ⇒  $\Delta ABC$  is isosceles, i.e.  $AB = BC$  and also  $\Delta IAC$  is isosceles  
 so  $IA = IC$  and  $\Delta AIQ \cong \Delta B'IQ$
- ⇒  $AI = B'I = CI$   
 i.e.  $I$  circumcentre as well incentre  $\Delta ABC$  is equilateral

6. Show that there are infinitely many positive real numbers  $a$  which are not integers such that  $a(a-3\{a\})$  is an integer.  
 (Here  $\{a\}$  denotes the fractional part of  $a$ . For example  $\{1.5\} = 0.5$ ;  $\{-3.4\} = 0.6$ ).

**Sol.** Let  $a = I + f$

- ⇒  $(I + f)(I - 2f)$  should be an integer
- ⇒  $I^2 - If - 2f^2$  should be an integer
- ⇒  $I^2 - f(I + 2f)$  should be an integer
- $f(I + 2f)$  should be an integer (Let =  $K$ )
- $2f^2 + If - K = 0$
- ⇒  $f = \frac{-I \pm \sqrt{I^2 + 8K}}{4}$  (ignore - sign as  $0 < f < 1$ )
- ⇒  $\sqrt{I^2 + 8K} - I < 4$
- $\sqrt{I^2 + 8K} < 4 + I$
- $I^2 + 8K < 16 + I^2 + 8I$
- $8K - 8I < 16$
- $K < I + 2$

For any  $I$ , we get possible values of  $K$  which makes given expression an integer.
